

The importance of a good ear impression

We have learned that many are struggling with how to know if the ear impressions are of a good standard.

To obtain the best comfort and fitting of the headset, it is important that starting point for the headset is the most optimal. The quality of the ear impressions must be high otherwise it makes it difficult to end up with the best possible headset for you.

You can help yourself and us to get the best result. The first step is to bring along the Ear Impression Standard when you go to visit a hearing clinic. You will receive the document when you receive with the order conformation otherwise you will be able to find on our website as well.

The second step is to inspect the impressions before leaving the hearing clinic. The impressions need to be smooth and without any voids – if there are voids on the surface, a new impression needs to be made. It is also very important that the impression covers the outside as indicated on the ear impression standard so the shape of the outer ear is possible to recreate and make the ear pieces comfortable to wear.

The last thing is to make sure that both the first and second bend are clear on the impressions. If the second bend is not clear on the impression, it will not be possible to use it for the making of the headset. The first and second bend are indicated on the illustrations on the right.

If all three steps are alright, you are one step closer to getting the perfect headset.
